---

# Termination

---

---

## Motivations

---

Termination is essential to proof  
correctness of programs.

But

Termination is an undecidable property.

## Undecidability of termination

---

Let  $a_1, a_2, a_3, \dots$  be an enumeration of all the algorithms on integers. We define the following functions :

$\text{end}(i, n) \equiv 1$  if  $a_i(n)$  terminates       $\text{Diag}(i) \equiv$  if  $\text{end}(i, i) = 1$  then loop  
 $\text{end}(i, n) \equiv 0$  if  $a_i(n) \neg$  terminates      else stop

For every  $i$ ,  $\text{Diag}(i)$  terminates iff  $a_i(i)$  does not terminate.

But  $\text{Diag}$  is an algorithm, so that  $\exists a_j$  s.t.  $\text{Diag} = a_j$ . We then have

$\text{Diag}(j)$  terminates iff  $a_j(j)$  terminates, that is

$a_j(j)$  terminates iff  $a_j(j)$  does not terminate.

Which is the error in the proof? The existence of the function end.

## Termination of a very simple system

---

$$f(g(x), y) \rightarrow f(y, y)$$

is not even trivial!

$$f(g(a), g(a)) \rightarrow f(g(a), g(a)) \rightarrow f(g(a), g(a)) \rightarrow \dots$$

## Techniques to show termination

---

- Reduction orders
  - Particular case : interpretations
  - Example of interpretation : polynomial orders
- Useful orders :
  - Lexicographic order
  - Multi-set order
- Simplification orders
  - General result
  - Example : RPO
- Combination of orders :
  - Motivations
  - Postponement
  - Projection/simulation
- Dependency pairs

## Recall

---

The symbol  $f \in \Sigma$  is **monotonic** w.r.t the relation  $R$  iff  $a_i R b_i$  implies  $f(a_1, \dots, a_i, \dots, a_n) R f(a_1, \dots, b_i, \dots, a_n)$ .

A relation  $R$  over  $\mathcal{T}(\mathcal{X}, \Sigma)$  is **stable by substitution** iff  $t R t'$  implies  $\theta(t) R \theta(t')$  for every substitution  $\theta$ .

## Termination by reduction orders

---

**Pre-order** : reflexive and transitive relation

and thus antisymmetric

**Partial order** : reflexive, transitive and antisymmetric relation.

**Strict order** : irreflexive and transitive relation.

A strict order  $\succ$  over a signature  $\Sigma$  is a **reduction order** iff

1. Each symbol  $f \in \Sigma$  is monotone w.r.t  $\succ$
2.  $\succ$  is stable by substitution
3.  $\succ$  is WF

Why reduction orders are important?

**Theorem :** A rewriting system  $\mathcal{R}$  terminates **iff** there exists a reduction order  $\succ$  s.t.  $l \succ r$  for every rewriting rule  $l \rightarrow r \in \mathcal{R}$ .

## How does it work ?

---

Does  $\mathcal{R}$  terminate ?

$$\mathcal{R} = \begin{cases} \text{por}(x, t) & \rightarrow t \\ \text{por}(t, x) & \rightarrow t \end{cases}$$

The number of  size of  $s$  decreases....

" $s \succ t$  iff  $|s| > |t|$ " is not a reduction order :

$|\text{por}(x, \text{por}(y, t))| > |\text{por}(y, y)|$  but

$|\text{por}(t, \text{por}(\text{por}(t, t), t))| \not> |\text{por}(\text{por}(t, t), \text{por}(s, t))|$

" $s \succ t$  iff  $|s| > |t|$  and for every variable  $x$  we have  $|s|_x \geq |t|_x$ " is a reduction order.

 number of  $x$  in  $s$

## Interpretation as particular case of reduction order

---

The reduction order is first defined on the **interpretation** of terms, and not directly on terms.

Let  $\succ_{\mathcal{A}}$  be a WF strict order over the domain of a  $\Sigma$ -algebra  $\mathcal{A}$ .

This order is defined on the interpretations of  $s$  and  $t$  given by :

$$s \succ t \text{ iff } \Phi(s) \succ_{\mathcal{A}} \Phi(t) \text{ for all homomorphisms } \Phi : \mathcal{T}(\mathcal{X}, \Sigma) \rightarrow \mathcal{A}$$

**Theorem :** If for every  $f \in \Sigma$ , the interpretation  $f^{\mathcal{A}}$  is monotone w.r.t.  $\succ_{\mathcal{A}}$ , then  $\succ$  is a reduction order.

## Example : polynomial orders

---

with  $n$  indeterminates and coefficients in  $\mathbb{N}$

- A domain which is a subset of  $\mathbb{N}$
- A polynomial  $P_f$  for each  $f/n \in \Sigma$ , there is s.t.  
 $f^{\mathcal{P}_{\mathbb{N}}}(a_1, \dots, a_n) = P_f(a_1, \dots, a_n).$

**Example :** Let  $\Sigma = \{f/2, g/2, a/0\}$ . Consider the morphism  $\Phi$  given polynomials  $P_f(x, y) = x.y$  and  $P_g(x, y) = 2.x + y + 1$  and  $P_a = 2$ . Then we have  $\Phi(f(a, g(a, a))) = 2.(2.2 + 2 + 1).$

**Problem :** Polynomials are not necessarily monotone, for example if  $P_f(X, Y) = X^2$  we have  $3 > 2$  but  $P_f(2, 3) = 4 \not\geq 4 = P_f(2, 2).$

## Towards a polynomial order as interpretation

---

A polynomial  $P$  is **completely monotone** iff it depends on all its indeterminates.

**Example :**  $P(x, y) = 3.x + y + 2$  and  $P(x, y) = x.y$  are all completely monotone.

**Theorem :** Let  $\mathcal{P}_{\text{IN}}$  be a polynomial  $\Sigma$ -algebra. If every  $f^{\mathcal{P}_{\text{IN}}}$  is a completely monotone polynomial, then the order  $\succ$  associated to  $\succ_{\mathcal{P}_{\text{IN}}}$  is a reduction order.

## How does it work ?

---

Does  $\mathcal{R}$  terminate ?

$$\mathcal{R} = \left\{ f(x, g(y, z)) \rightarrow g(f(x, y), f(x, z)) \right.$$

1. Define the domain :  $\mathbb{N} - \{0, 1\}$ .
2. Define a polynomial for every function symbol :  
 $P_f(x, y) = x.y$  et  $P_g(x, y) = 2.x + y + 1$ .
3. Prove that  $f(x, g(y, z)) \succ g(f(x, y), f(x, z))$  : Prove  
 $\sigma(x).(2.\sigma(y) + \sigma(z) + 1) \succ_{\mathcal{P}_{\mathbb{N}}} 2.\sigma(x).\sigma(y) + \sigma(x).\sigma(z) + 1$   
for every  $\sigma(x), \sigma(y), \sigma(z) \neq 0, 1$ .

## Lexicographic order - particular case

---

Let  $(A_1, >_{A_1})$  and  $(A_2, >_{A_2})$  be two strict ordered sets.

$$(x, y) >_{lex} (x', y') \text{ iff } (x >_{A_1} x') \text{ or } (x = x' \text{ and } y >_{A_2} y')$$

**Example :**

$$(4, \text{"abc"}) >_{lex} (3, \text{"abc"}) >_{lex} (2, \text{"abcde"}) >_{lex} \\ (2, \text{"bcde"}) >_{lex} (2, \text{"e"}) >_{lex} (1, \text{"e"}) >_{lex} (0, \epsilon)$$

## Lexicographic order - General case

---

If every  $>_{A_i}$  is a strict order over the set  $\mathcal{A}_i$ , then  $>_{lex}$  is a strict order over  $\mathcal{A}_1 \times \dots \times \mathcal{A}_n$  defined as follows :

$$(x_1, \dots, x_n) >_{lex} (x'_1, \dots, x'_n) \text{ iff } \begin{aligned} &\exists 1 \leq j \leq n \\ &(x_j >_{A_j} x'_j \text{ and } \forall 1 \leq i < j \ x_i = x'_i) \end{aligned}$$

**Theorem :** Every order  $>_{A_i}$  over  $\mathcal{A}_i$  is well-founded iff the lexicographic order  $>_{lex}$  over  $\mathcal{A}_1 \times \dots \times \mathcal{A}_n$  is well-founded.

## How does it work ?

---

Does the following program terminate ?

$$\text{ackerman}(0, n) \rightarrow n+1$$

$$\text{ackerman}(m+1, 0) \rightarrow \text{ackerman}(m, 1)$$

$$\text{ackerman}(m+1, n+1) \rightarrow \text{ackerman}(m, \text{ackerman}(m+1, n))$$

*Proof.* We show that  $\text{ackerman}(m, n)$  terminates by induction on  $(m, n)$  w.r.t. the lexicographic order. ■

## Another example ?

---

Does the following program terminate ?

$$f(f(x)) \rightarrow g(f(x))$$

$$g(g(x)) \rightarrow f(x)$$

*Proof.* We show that  $t \rightarrow u$  implies  $(|t|, |t|_f) >_{lex} (|u|, |u|_f)$ .

■

## Multi-set order

---

A **multi-set** over a set  $\mathcal{A}$  is a function  $\mathcal{M} : \mathcal{A} \rightarrow \mathbb{N}$ . It is **finite** if  $\mathcal{M}(x) > 0$  only for a finite number of elements of  $\mathcal{A}$ .

**Example** :  $\{\{a, a, b\}\}$ .

Let  $\mathcal{M}$  and  $\mathcal{N}$  be two multi-sets. The **multi-set union** is defined by  $\mathcal{M} \uplus \mathcal{N}(a) = \mathcal{M}(a) + \mathcal{N}(a)$ .

## Multi-set order

---

Let  $\succ$  a strict order. The associated relation  $\succ_{mul}$  is given by the **transitive closure** of the relation  $\succ_{mul}$  :

$\mathcal{M} \uplus \{x\} \succ_{mul} \mathcal{M} \uplus \{y_1, \dots, y_n\}$ , where  $n \geq 0$  and  $\forall i, x \succ y_i$ .

**Example** :  $\{5, 3, 1, 1\} \succ_{mul} \{4, 3, 3, 1\}$ .

Since  $\{5, 3, 1, 1\} \succ_{mul} \{4, 3, 3, 1, 1\} \succ_{mul} \{4, 3, 3, 1\}$

**Theorem** : Let  $\succ$  be a strict order over  $\mathcal{A}$ , then  $\succ$  is WF iff  $\succ_{mul}$  is WF.

## How does it work ?

---

A rich but bored man decides to have fun every day with his money (in euros) in the following way :

- either he throw a coin in the fountain,
- or he changes a banknote into an equivalent amount of coins.

Show that the man necessarily becomes poor.

- Represent the initial amount of money by a multi-set.
- Represent the daily activity of the man by a decreasing order on multi-sets.

## Other known examples

---

- Hercules defeats Hydra
- Cut elimination in Gentzen style systems
- Amoebae reproduction
- Recursive Path Orderings

## Simplification orders

---

A **simplification order** over  $\mathcal{T}(\mathcal{X}, \Sigma)$  is an order  $\succ$  s.t.

1. All the symbols of  $\Sigma$  are monotone w.r.t  $\succ$
2.  $\succ$  is stable by substitution
3.  $t \triangleright u$  implies  $t \succ u$

## Example : embedding

---

The relation  $s \triangleq_{emb} t$  holds iff one of the following cases hold

- $s$  and  $t$  are the same variable
- $s = f(s_1, \dots, s_n)$  and  $t = f(t_1, \dots, t_n)$  and  $\forall i \ s_i \triangleq_{emb} t_i$
- $s = f(s_1, \dots, s_n)$  and there is  $j$  s.t.  $s_j \triangleq_{emb} t$

**Example :**  $f(f(h(h(a)), h(x)), f(h(x), a)) \triangleright_{emb} f(f(a, x), x)$

## Termination by simplification orders

---

**Lemme :** The relation  $\triangleright_{emb}$  is contained in every simplification order.

**Lemme :** If  $\succ$  is a simplification order, then it is a reduction order (and thus WF).

*Proof.* Uses the famous Kruskal's Theorem. ■

## And the inverse ?

---

Let  $\mathcal{R} = f(f(x)) \rightarrow f(g(f(x)))$ .

The system  $\mathcal{R}$  terminates (exercise).

Thus  $\rightarrow_{\mathcal{R}}^+$  is a reduction order.

Suppose that  $\rightarrow_{\mathcal{R}}^+$  is also a simplification order.

Then  $f(g(f(x))) \triangleright_{emb} f(f(x))$  implies

$f(g(f(x))) \rightarrow^+ f(f(x)) \rightarrow^+ f(g(f(x))) \dots$

Contradiction with the termination of  $\mathcal{R}$ .

## Example: reflexive and transitive ordering

---

Let  $\succsim_{\Sigma}$  be a pre-order over  $\Sigma$ . We associate to each symbol  $f \in \Sigma$  a **status** in  $\{LEX, MUL\}$  s.t. if  $f \sim g$ , then

- $f$  and  $g$  have the same status,
- and if the status is *LEX*, then  $f$  and  $g$  have the same arity.

We note  $f \in \Sigma_{LEX}$  to indicate that  $f \in \Sigma$  has LEX status.

## The order $\succ_{rpo}$

---

Let  $\succ_{\Sigma}$  be a pre-order over a signature  $\Sigma$  such that  $\succ_{\Sigma}$  is WF.

The **RPO** is given by  $s \succ_{rpo} t$  iff

1. **[sub-term]**  $s = f(s_1, \dots, s_n)$  and  $\exists i$  s.t.  $s_i \succ_{rpo} t$  or  $s_i = t$  or
2. **[Two symbols]**  $s = f(s_1, \dots, s_n)$ ,  $t = g(t_1, \dots, t_m)$  and one of the following conditions is verified
  - (a) **[precedence]**  $f \succ_{\Sigma} g$  and for all  $j$ ,  $s \succ_{rpo} t_j$
  - (b) **[multi-set]**  $f \sim_{\Sigma} g$  have MUL status and  $\{\{s_1, \dots, s_n\}\}(\succ_{rpo})_{mul} \{\{t_1, \dots, t_m\}\}$ .
  - (c) **[lexicographic]**  $f \sim_{\Sigma} g$  have LEX status and  $(s_1, \dots, s_n)(\succ_{rpo})_{lex}(t_1, \dots, t_m)$  and for all  $j$ ,  $s \succ_{rpo} t_j$

## Alternative definition of RPO

---

$$\frac{\exists i (s_i \succ_{rpo} t \text{ or } s_i = t)}{f(s_1, \dots, s_n) \succ_{rpo} t} \quad [1]$$

$$\frac{f \succ_{\Sigma} g \text{ and } \forall j s \succ_{rpo} t_j}{s = f(s_1, \dots, s_n) \succ_{rpo} g(t_1, \dots, t_m)} \quad [2.a]$$

$$\frac{f \sim_{\Sigma} g \in \Sigma_{MUL} \text{ and } \{s_1, \dots, s_n\} (\succ_{rpo})_{mul} \{t_1, \dots, t_m\}}{s = f(s_1, \dots, s_n) \succ_{rpo} g(t_1, \dots, t_m) = t} \quad [2.b]$$

$$\frac{f \sim_{\Sigma} g \in \Sigma_{LEX} \text{ and } (s_1, \dots, s_n) (\succ_{rpo})_{lex} (t_1, \dots, t_m) \text{ and } \forall j s \succ_{rpo} t_j}{s = f(s_1, \dots, s_n) \succ_{rpo} g(t_1, \dots, t_m) = t} \quad [2.c]$$

## Remarks

---

- Is this definition well-founded?
- Can we avoid condition  $s \succ_{rpo} t_j$  in case LEX [2.c]?  
We would have that  $a \succ_{\Sigma} a'$  implies  $f(a, b) \succ_{rpo} f(a', f(a, b))$
- If all the symbols are LEX, the order is known as *LPO*.
- If all the symbols are MUL, the order is known as *MPO*.

## Property of $\succ_{rpo}$

---

**Theorem :** The relation  $\succ_{rpo}$  is a WF order.

The RPO was extended to the higher-order case by Jouannaud and Rubio.

## Simple example

---

$$\mathcal{R} \left\{ \begin{array}{l} 0 + y \quad \rightarrow_{r1} \quad y \\ s(x) + y \quad \rightarrow_{r2} \quad s(x + y) \\ 0 * y \quad \rightarrow_{r3} \quad 0 \\ s(x) * y \quad \rightarrow_{r4} \quad (x * y) + y \end{array} \right.$$

- Define  $* \succ_{\Sigma} + \succ_{\Sigma} s \succ_{\Sigma} 0$ , all with MUL (or LEX) status.
- Show that  $l \succ_{rpo} r$  for each rule  $l \rightarrow r \in \mathcal{R}$ .

Thus for example for rule  $s(x) * y \rightarrow_{r4} (x * y) + y$

$$\begin{array}{c}
 \frac{x = x}{s(x) \succ_{rpo} x} \\
 \frac{* \sim_{\Sigma} * \quad \frac{\{s(x), y\} (\succ_{rpo})_{mul} \{x, y\}}{s(x) * y \succ_{rpo} (x * y)}}{s(x) * y \succ_{rpo} (x * y)} \quad \frac{y = y}{s(x) * y \succ_{rpo} y} \\
 \frac{* \succ_{\Sigma} + \quad \frac{s(x) * y \succ_{rpo} (x * y) \quad s(x) * y \succ_{rpo} y}{s(x) * y \succ_{rpo} (x * y) + y}}{s(x) * y \succ_{rpo} (x * y) + y}
 \end{array}$$

## Famous example : cut elimination in intuitionistic logic

$x[x/t]$	$\rightarrow$	$t$
$y[x/t]$	$\rightarrow$	$y$
$(\lambda z.u)[x/t]$	$\rightarrow$	$\lambda z.u[x/t]$
$(y \text{ of } u \text{ is } w \text{ in } v)[x/t]$	$\rightarrow$	$y \text{ of } u[x/t] \text{ is } w \text{ in } v[x/t]$
$(x \text{ of } u \text{ is } w \text{ in } v)[x/y]$	$\rightarrow$	$y \text{ of } u[x/y] \text{ is } w \text{ in } v[x/y]$
$(x \text{ of } u \text{ is } w \text{ in } v)[x/z.t]$	$\rightarrow$	$v[x/\lambda z.t][w/t[z/u[x/\lambda z.t]]]$
$(x \text{ of } u \text{ is } w \text{ in } v)[x/x' \text{ of } t' \text{ is } z \text{ in } t]$	$\rightarrow$	$x' \text{ of } t' \text{ is } z \text{ in } ((x \text{ of } u \text{ is } w \text{ in } v)[x/t])$

## Combining orders

---

Suppose two SN relations  $\mathcal{R}_1$  and  $\mathcal{R}_2$ . What about  $\mathcal{R}_1 \cup \mathcal{R}_2$ ?

Counter-example by Toyama :

$$\mathcal{R}_1 = f(x, a, b) \rightarrow f(x, x, x)$$

$$\mathcal{R}_2 = g(x, a) \rightarrow x$$

which do not share symbols !

The systems  $\mathcal{R}_1$  and  $\mathcal{R}_2$  are SN but  $\mathcal{R}_1 \cup \mathcal{R}_2$  is not :

$$f(g(a, b), g(a, b), g(a, b)) \rightarrow_{\mathcal{R}_2} f(g(a, b), a, g(a, b)) \rightarrow_{\mathcal{R}_2}$$

$$f(g(a, b), a, b) \rightarrow_{\mathcal{R}_1} f(g(a, b), g(a, b), g(a, b)) \rightarrow \dots$$

## Termination by postponement

---

A relation  $\mathcal{R}$  can be **postponed** w.r.t. a relation  $\mathcal{S}$  iff

for all  $s, t, u$  s.t.  $s \rightarrow_{\mathcal{R}} t \rightarrow_{\mathcal{S}} u$

there is  $v$   $s \rightarrow_{\mathcal{S}}^+ v \rightarrow_{\mathcal{R} \cup \mathcal{S}}^* u$

**Theorem :** Let  $\mathcal{R}$  and  $\mathcal{S}$  be two WF relations s.t.  $\mathcal{R}$  can be postponed w.r.t.  $\mathcal{S}$ . Then the relation  $\mathcal{R} \cup \mathcal{S}$  is WF.

**Corollaire :** If  $\mathcal{S}$  is WF, then  $\mathcal{S} \cup \triangleright$  is WF.

## Example

---

Consider **simply typed**  $\lambda$ -calculus with the following rules :

$$(\lambda x.M)N \rightarrow_{\beta} M\{x/N\}$$

$$\lambda x.M x \rightarrow_{\eta} M$$

$$M \rightarrow_{\Omega} \star$$

Let  $\mathcal{R} = \eta \cup \Omega$  and  $\mathcal{S} = \beta$ . Now,

- Show that  $\eta \cup \Omega$  can be **postponed** w.r.t.  $\beta$ .
- Since  $\beta$  is SN, then conclude that  $\eta \cup \Omega \cup \beta$  is SN.

## Termination by projection/simulation

---

**Theorem :** Let  $\mathcal{R}_1, \mathcal{R}_2$  be two relations over  $O$  s.t.

1.  $\mathcal{R}_2$  terminates
2. There is a **simulation**  $\mathcal{T} : O \rightarrow O'$  and a **relation**  $\mathcal{S}$  over  $O'$  s.t.
  - $a \rightarrow_{\mathcal{R}_1} b$  implies  $\mathcal{T}(a) \rightarrow_{\mathcal{S}}^+ \mathcal{T}(b)$ ,
  - $a \rightarrow_{\mathcal{R}_2} b$  implies  $\mathcal{T}(a) \rightarrow_{\mathcal{S}}^* \mathcal{T}(b)$ .

Then, if  $\mathcal{S}$  terminates,  $(\mathcal{R}_1 \cup \mathcal{R}_2)$  also terminates.

## (Famous) Example

---

Consider **simply typed** extensional  $\lambda$ -calculus

$$(\lambda x.M) N \rightarrow_{\beta} M\{x/N\}$$

$$\pi_1 \langle M, N \rangle \rightarrow_{\pi_1} M$$

$$\pi_2 \langle M, N \rangle \rightarrow_{\pi_2} N$$

$$M \rightarrow_{\eta_{exp}} \lambda x.Mx \quad \text{if} \left\{ \begin{array}{l} M \text{ is of functional type} \\ M \text{ is not a } \lambda\text{-abstraction} \\ M \text{ is not applied in } C[M] \end{array} \right.$$

$$M \rightarrow_{sp_{exp}} \langle \pi_1(M), \pi_2(M) \rangle \quad \text{if} \left\{ \begin{array}{l} M \text{ is of product type} \\ M \text{ is not a pair} \\ M \text{ is not projected in } C[M] \end{array} \right.$$

Thus for example if  $z : A \times B$  and  $x : (A \times B) \rightarrow (C \rightarrow D)$ , then

$$I x z \rightarrow_{\beta} x z \rightarrow_{sp_{exp}} x \langle \pi_1(z), \pi_2(z) \rangle \rightarrow_{\eta_{exp}} \lambda y. (x \langle \pi_1(z), \pi_2(z) \rangle) y$$

Let  $\mathcal{R}_1 = \beta \cup \pi_1 \cup \pi_2$  and  $\mathcal{R}_2 = \eta_{exp} \cup sp_{exp}$  and

$\mathcal{S} = \beta \cup \pi_1 \cup \pi_2$ . Now,

- Show that  $\eta_{exp} \cup sp_{exp}$  is terminating.
- Show that  $\beta \cup \pi_1 \cup \pi_2$  is terminating (done).
- Show that  $\eta_{exp} \cup sp_{exp}$  is also confluent.
- Define  $\mathcal{T}(t)$  as the  $\eta_{exp} \cup sp_{exp}$ -normal form of  $t$ .
- Show that  $t \rightarrow_{\beta \cup \pi_1 \cup \pi_2} t'$  implies  $\mathcal{T}(t) \rightarrow_{\beta \cup \pi_1 \cup \pi_2}^+ \mathcal{T}(t')$
- Show that  $t \rightarrow_{\eta_{exp} \cup sp_{exp}} t'$  implies  $\mathcal{T}(t) = \mathcal{T}(t')$  (evident).
- Conclude that all the system  $\mathcal{R}_1 \cup \mathcal{R}_2$  is SN.

## Termination by Dependency Pairs

---

- The technique is due to Aarts and Giesl.
- The order does not decrease for **every** step, but for the **dependent** one.
- The technique is very suitable for functional programming.
- It was extended to higher-order by Sakai and Kusakari.
- It was extended to abstract rewriting by Lengrand.
